JSK URJA CRM Platform Setup Guide

End-to-end instructions for Super Admin setup: industry templates, companies, module allocation, feature engine, users, and Handloom go-live checklist.

Document: CRM_Setup_Guide - A4 print/PDF via Puppeteer

Start here — which step first?

Always start as Super Admin. Do not create users or masters until Steps 1–4 below are done. Wrong order is the #1 reason menus are missing or too many modules appear.

Step	Start here if...	What to do	What to check before next step
0	Every new setup	Logout if needed → login as <code>superadmin</code> (not Company Admin) → <code>/admin/home</code>	☒ Sidebar shows Super Admin menus · ☒ NOT only Sales/Purchase/CRM menus
1	New business type OR first time setup	<code>/admin/industry-templates</code> — create or verify template (e.g. <code>TEXTILE_HANDLOOM</code>)	☒ Template code is correct · ☒ <code>isActive</code> = on · ☒ Default module list matches business type
2	Every new company	<code>/admin/companies</code> — Add company + link Industry template	☒ Company appears in top company selector · ☒ Correct template linked · ☒ Select that company in header
3	After company exists (mandatory)	<code>/admin/module-allocation</code> → Apply template defaults → toggle modules → Save	☒ <code>moduleGuardEnabled</code> on · ☒ Only needed modules ON · ☒ Wrong modules OFF (e.g. PCB off for Handloom) · ☒ Re-login and sidebar matches
4	After modules saved	<code>/admin/feature-compliance-settings</code> — set Customer, GST, Inventory, Sales flags	☒ Company tab toggles saved · ☒ Required fields visible on customer/item forms · ☒ GST/accounting flags match business
5	After features saved	<code>/company-profile</code> — legal name, GSTIN, address, FY, logo	☒ GSTIN/PAN filled · ☒ Financial year active · ☒ Invoice/voucher series configured
6	After profile done	<code>/admin/users</code> — create company Admin + staff users	☒ Each user has role · ☒ Permissions only for enabled modules · ☒ Test login as company Admin (not superadmin)
7	Before daily use	Masters: item groups, items, account groups, ledgers, task groups	☒ Sample item + ledger created · ☒ One test invoice or challan works · ☒ Stock/GST numbers look correct

Skip nothing: Step 3 (Module Allocation) is the gate. Until you Save there, a company may show ALL modules (legacy JSK behavior). For Handloom, never skip Step 3.

Quick decision — where do I start today?

- **Brand-new Handloom company** → Start at Step 1 (verify `TEXTILE_HANDLOOM`) then Steps 2 → 3 → 4.
- **Company exists but wrong menus** → Start at Step 3 only. Check template + Save allocation. Re-login.
- **Menus OK but fields/forms wrong** → Start at Step 4 (Feature Configuration). Do not change modules unless menu is wrong.
- **JSK electronics (legacy)** → Step 2 + profile only until you intentionally configure Step 3.

Three setup layers

Configure the platform top-down. Each layer builds on the previous one; skipping a layer causes missing menus, blocked APIs, or wrong defaults.

1

Platform / Industry

Industry Template Master (`/admin/industry-templates`), platform feature defaults, workflow master. Defines template codes (e.g. `TEXTILE_HANDLOOM` , `ELECTRONICS_JSK`) and default module sets.

2

Module allocation

Per-company enablement at `/admin/module-allocation` . Sets `enabledModules` , optional `disabledModules` , links `industryTemplateRef` , and turns on `moduleGuardEnabled` when allocation is configured.

3

Feature settings

Feature Configuration Engine at `/admin/feature-compliance-settings` (legacy alias `/admin/feature-configuration`). Toggles compliance, customer fields, GST, inventory behavior, and registry overrides per company.

Company master data

Create/edit company at `/admin/companies` and legal profile at `/company-profile` (company Admin). Assign financial year, GST, and users after layers 1–3.

Order of operations: Template → Company record → Module allocation (Apply template defaults) → Feature settings → Users & permissions → Masters (items, ledgers, groups).

Roles: Super Admin vs Admin

Super Admin (`superadmin`)

- Full platform menus: SaaS, industry templates, module allocation, platform feature defaults, diagnostics, backups.
- Only role that may open platform paths under `/admin/industry-templates` , `/admin/module-allocation` , `/admin/platform-feature-defaults` , `/admin/companies` (platform list).
- Sees **Engine** tabs in Feature Configuration (Modules, Registry → Compliance/Customer/Supplier/Industry).
- Non-Super Admin users hitting platform routes are redirected to platform access denied.

Company Admin (`admin`)

- Manages day-to-day setup inside an allocated company: users, permissions, company profile, masters.
- Uses Feature Configuration **Company** tabs only (Customer, Sales, GST, Inventory, etc.).
- Cannot change industry templates or cross-tenant module allocation unless granted Super Admin.
- Module guard still applies: menus and APIs for disabled modules are hidden/blocked.

Permission model (summary)

Module allocation controls *which modules exist* for a company. Role permissions control *what a user may do* inside enabled modules. Configure users at `/admin/users` and fine-grained permissions via the permissions API / SaaS permission UI groups.

Already logged in as JSK Company Admin? Role `admin` is *not* the same as `superadmin` . Company Admin can create staff users for JSK, but **cannot** create Super Admin users or open platform pages (Industry Templates, Module Allocation, Companies list). For those steps you must log in with a `superadmin` account.

How to get Super Admin access (if you are only Company Admin)

Two different logins exist. Do not confuse username `admin` with role `superadmin`.

Check	Company Admin (<code>admin</code> role)	Platform Super Admin (<code>superadmin</code> role)
Sidebar shows	Sales, Purchase, CRM, Company Profile, Users	Super Admin section: SaaS, Industry Templates, Module Allocation, Companies
Can open <code>/admin/module-allocation</code>	No — access denied	Yes
Can create users at <code>/admin/users</code>	Yes — for own company only	Yes — any company
Can assign <code>superadmin</code> role	No — blocked by system	Yes
Typical use	Daily JSK operations	New company setup, industry templates, module allocation

Step A — Confirm which role you have now

1. After login, open sidebar. If you see **Super Admin** → **Platform Setup** → **Industry Template Master**, you are already Super Admin — use that session for setup steps 1–4.
2. If you only see normal ERP menus (Sales, Purchase, etc.), you are Company Admin — continue to Step B.
3. Optional: open your user profile / user list and check **Role** column — must show `superadmin`, not `admin`.

Step B — Log in as Super Admin

1. **Logout** from your current Company Admin session.
2. Login with the platform owner account. On fresh installs the default is username `admin` with role `superadmin` (password set during first install / seed).
3. If default login does not show Super Admin menus, your `admin` user may have been downgraded to Company Admin — a developer or DBA must promote that user in the database (`roleName: superadmin`).

Step C — Create users (correct role for each person)

Who to create	Which login to use	Role to assign
Handloom / new company setup person	Super Admin login	Do setup yourself; then create company Admin for that tenant
JSK daily operator (accounts, sales staff)	Company Admin login (JSK)	<code>admin</code> , <code>accounts</code> , <code>sales</code> , etc. — not superadmin
Second platform owner	Super Admin login only	<code>superadmin</code> — only Super Admin can assign this

Rule: Company Admin at `/admin/users` will never see `superadmin` in the role dropdown. This is intentional security — not a bug.

Industry Template Master

URL: `/admin/industry-templates` · Super Admin only

- 1. Open Industry Template Master → **Add** or edit an existing row.
- 2. Set **Template name**, unique **Template code** (uppercase snake case), description, active flag.
- 3. Configure template settings sections: Module, Field, Workflow, SOP, Production Process, Document, Report, Dashboard.
- 4. Use panels: Customer fields, Supplier fields, Item fields, Documents/KYC, default module list.
- 5. Save and ensure `isActive` is on before linking companies.

Standard template codes

Code	Typical use	Module guard
<code>ELECTRONICS_JSK</code>	JSK URJA / electronics manufacturer	All modules; module guard off (legacy-compatible)
<code>TEXTILE_HANDLOOM</code>	Handloom / textile (alias TEXTILE)	Textile modules + core ERP; enforce module guard
<code>TRADING</code>	Trading / distribution	Sales, purchase, inventory, finance; guard on
<code>MANUFACTURING_GENERAL</code>	General manufacturing	Production + core ERP
<code>EXPORTER</code>	Export trading	Sales, GST, china sourcing, documents
<code>SERVICE</code>	Service / complaints	CRM, service, accounts, reports

`TEXTILE` is kept as an alias for `TEXTILE_HANDLOOM` for existing Handloom databases.

Company creation

Platform list: `/admin/companies` · Company profile (tenant): `/company-profile`

1 Super Admin — create company

Add company name, client code (optional), link **Industry template** (`industryTemplateRef`). This drives default modules when allocation is applied.

2 Select company in the top company selector so all admin pages target the correct tenant.

3 Company profile — legal name, address, GSTIN, PAN, logo, bank, FY settings (permission: `admin.company_profile.view`).

4 Financial year and voucher series — via Accounts masters after feature flags confirm accounting is enabled.

Do not enable module guard for JSK legacy default company until you intentionally configure allocation; unconfigured allocation preserves legacy “all modules” behavior for `ELECTRONICS_JSK` .

Module allocation — step by step

URL: `/admin/module-allocation`

- 1** Log in as **Super Admin** and select the target company.
- 2** Choose **Industry template** from the dropdown (loaded from active templates).
- 3** Click **Apply template defaults** — sets `enabledModules` from template, sets `moduleAllocationConfigured` and `moduleGuardEnabled` **true**.
- 4** Review modules by group (core, textile, electronics, finance, admin). Toggle individual module codes on/off.
- 5** Optional: add `disabledModules` to force-off modules that remain in the enabled list (subtractive override).
- 6** Optional deployment block: database name, backend URL, frontend URL, deployment status (multi-deployment tracking).
- 7** **Save** — refreshes module guard context; users may need re-login to see menu changes.

Module registry (canonical codes)

Mirrored in backend `moduleRegistry.constants.js` and module allocation UI.

Code	Label	Group	Scope
crm	CRM	core	Customers, leads, follow-ups, product catalog
tasks	Task Management	core	Tasks, task groups, categories
messenger	Messenger	core	Internal messenger / task chat groups
whatsapp	WhatsApp	core	WhatsApp inbox and messaging
whatsapp_bulk	WhatsApp Bulk Messaging	core	Campaigns, matters, blacklist, history
email	Platform Email	core	Email settings and communication history
email_bulk	Email Bulk Messaging	core	Bulk email campaigns and templates
sales	Sales	core	Orders, invoices, e-way, e-invoice
purchase	Purchase	core	Suppliers, PO, GRN, purchase invoices
inventory	Inventory	core	Items, groups, stock, BOM entry points
documents	Documents / Scan	core	Scan entry, smart import, import center
production	Production (General)	core	Work orders, production sheets
service	Service / Complaints	core	Complaints, repairs, replacements
accounts	Accounts / Vouchers	finance	Ledgers, vouchers, books, petty cash
gst	GST	finance	GSTR-1/3B/9, reconciliation, ITC
tds	TDS	finance	TDS masters, deductions, challans, 26AS
tcs	TCS	finance	TCS masters, deductions, challans
reports	Reports / MIS	core	MIS, director reports, CRM reports
fixed_assets	Fixed Assets	finance	Asset register and depreciation
china_sourcing	China Sourcing / WeChat	core	WeChat groups, samples, pricing
hr	HR / Payroll	core	HR module entry
rd	R&D / PRD	electronics	PRD projects, RD samples
payroll	Payroll	finance	Payroll processing
admin	Admin / Settings	admin	Company profile, permissions, platform setup
bom	BOM	electronics	Bill of materials
pcb	PCB Production	electronics	PCB workflow
smd	SMD Production	electronics	SMD workflow
qc	QC / Testing	electronics	QC and retest
fabric_purchase	Fabric Purchase	textile	Fabric purchase workflow

Code	Label	Group	Scope
than_meter_stock	Than / Meter Stock	textile	Than and meter stock
dyeing	Dyeing	textile	Dyeing job work challan, issue/return
embroidery	Embroidery	textile	Embroidery process
printing	Printing	textile	Printing process
stitching	Stitching	textile	Stitching process
textile_job_work	Textile Job Work	textile	Rates, challan, return, reports
lot_tracking	Lot Tracking	textile	Production lots and process routes
multi_uom	Multi-UOM	textile	Conversion and transformation

Feature Configuration Engine

Primary URL: `/admin/feature-compliance-settings` · Query param: `?tab=...`

Engine tabs (Super Admin only)

- `engine-module` — Modules registry overrides
- `engine-compliance` — Registry → Compliance
- `engine-customer` — Registry → Customer
- `engine-supplier` — Registry → Supplier
- `engine-industry` — Registry → Industry

Company tabs (Admin & Super Admin)

Customer · Industry / Production · Sales · GST · Inventory · Accounting · TDS/TCS · Manufacturing · SaaS/Permissions · Purchase · Workflow / Kanban · UI Customization · CRM · Communication

Disabled features hide menus and block related APIs; existing data is not deleted. Platform defaults:

`/admin/platform-feature-defaults` .

Legacy route `/admin/feature-configuration` redirects to feature-compliance with the same tab id.

Six types of “groups”

Different modules use the word “group” for different master data — configure each after modules are allocated.

Type	Where	Purpose
Task groups	Task Management	Organize tasks and team workload (<code>/tasks</code> , task-groups API)
Messenger groups	Messenger / WhatsApp	Chat channels linked to tasks or broadcast lists
Item groups	Inventory	Category tree for fabrics, SKUs, consumables (<code>item-groups</code>)
Account groups	Accounts	Chart of accounts hierarchy (Group Master / ledger parent groups)
WeChat groups	China Sourcing	Supplier conversation groups for sourcing (<code>china_sourcing</code> module)
Permission UI groups	Admin / SaaS	Bundle permissions for roles (module + action keys); assign on user/role screens

Users and permissions

1. Ensure company is selected and modules allocated.
2. Open `/admin/users` (Company Admin) — create users, assign role (admin, viewer, custom).
3. Grant permissions only for **enabled modules**; denied module APIs return guard errors.
4. Super Admin accounts are separate platform operators — do not use for daily Handloom operators.
5. After permission changes, users should refresh or re-login for menu cache updates.
6. WhatsApp / bulk / email modules require both module allocation and communication feature toggles.

New Handloom company — full checklist

- ☐ Create or verify `TEXTILE_HANDLOOM` industry template (active)
- ☐ Create company at `/admin/companies` and link template
- ☐ `/admin/module-allocation` → Apply template defaults → enable textile modules (job work, dyeing, lot tracking, fabric purchase, etc.)
- ☐ Confirm `pcb` , `bom` , `smd` electronics modules are **off**
- ☐ `/admin/feature-compliance-settings` — Customer/KYC, GST, inventory, manufacturing flags for textile
- ☐ Company profile + FY + invoice series
- ☐ Item groups, items, multi-UOM / conversion masters if used
- ☐ Account groups and ledgers; GST ledgers mapped
- ☐ Textile job work rate master → issue challan → return entry workflow tested
- ☐ Task groups and messenger groups for operations team
- ☐ Users, roles, permission UI groups
- ☐ WhatsApp module connected (if allocated) and test message
- ☐ Sample sales invoice + stock movement smoke test

Troubleshooting

Symptom	Likely cause	Fix
Menu item missing	Module not in <code>enabledModules</code> or in <code>disabledModules</code>	Module allocation → enable module → Save; refresh session
API 403 / module guard	Route mapped to disabled module	Check allocation; exempt paths only for health, auth, allocation config
Platform page "access denied"	User is not Super Admin	Use superadmin account or company-scoped admin routes
All modules visible on JSK company	<code>moduleAllocationConfigured</code> false	Expected legacy behavior until allocation saved
Textile company sees PCB/BOM menus	Wrong template or guard off	Apply TEXTILE_HANDLOOM defaults; enable module guard
Feature toggle has no effect	Wrong company selected	Select company in header; save feature settings again
Engine tabs missing	Logged in as company Admin	Super Admin required for Engine registry tabs
WhatsApp bulk missing	<code>whatsapp_bulk</code> not allocated	Enable module + communication feature flags
